```
A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat inflammation and associated pain. The treatment can also be used to produce analgesia (specially in subjects experiencing neuropathic pain); and to treat schizophrenia, tradive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS

                                                                                                                                                                                                                Sequences AAW95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electrically stimulated contraction of guinea pig ileum and (b) alectrically binding to omega conopeptide WVIA binding sites in neuronal tissue, where these activities are within the ranges of those of omega-conotoxins WVIA and TVIA. The method is
                                                                                                                                                                                                                                                                                                                                                         ö

Sequences AAW95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electrically stimulated contraction of guinea pig ileum and (b) selectrivaly binding to omega conopeptide WIIA binding sites in neuronal tissue, where these activities are within used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      binding;

test compounds in blocking voltage-gated to the omega conopeptide binding site and (noradrenaline) release for treating
Measuring the activity of calcium channels, binding inhibiting norepinephrine
                                                                                         inflammation
```

Disclosure; Fig 1; 47pp; English

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia in a mammalian subject with chronic or intractable pain. Analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention

Novel peptides used for the treatment of disorders and diseases where blockage of the N-type calcium channels is required.

Disclosure; Page 12; 81pp; English.

The present sequence represents an omega-conotoxin. Omega-conotoxins are isolated from venoms of predatory marine snails, and have a selectivity for N-type calcium channels over P/O type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in screen to identify compounds with activity at N-type voltage sensitive calcium channels Pred. No.

The present sequence is an omega-conopeptide from marine snails of the genus Conus. Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calcium channel blockers. Natural comega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                    Marine snail; omega-conopeptide; calcium channel blocker; MVIIC; SNX-230;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.

Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calcium channel blockers. Natural omega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norrepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardive dyskinesia and acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a
reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
a less therapeutically active amino acid region (IV), which covalently
conds with amino/hydroxyl/thiol groups on blood components to form a
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth
factors and neurotransmitters, to protect them from peptidase activity in
vivo for the treatment of various disorders. Endogenous therapeutic
convolor the treatment of various disorders. Endogenous therapeutic
convolor the treatment of various disorders is athey require frequent
administration due to rapid degradation by peptidases in the body.
Condifying and attaching therapeutic peptides to albumin prevents or
reduces the action of peptidases to increase length of activity (half
IIfe) and specificity as bonding to large molecules decreases
interacellular uptake and interference with physiological processes.

Omega-conopeptides are components of peptide toxins which act as voltage-gated calcium channel inhibitors. The peptides are used to enhance the analgesic effect produced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is able to linhibit electrically stimulated contraction of the guinea pig ileum and bind to omega-conopeptide MVITA binding sites present in neuronal its sue omega-conopeptides are useful for enhancing the analgesic effect produced by an opiate. Omega-conopeptides may also be used in the treatment of pain, in reducing schusophical damage related to an ischemic condition in mammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig ilium and binds to omega-conopeptide MVIIA binding sites in neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
The invention comprises peptides having calcium channel blocking activities which are derived from the venomous saliva of assassin bugs. The calcium channel blocking peptides of the invention are useful for treating stenocardia, hypertension, myocarditis, arrhythmia and cerebral ischaemia. The present amino acid sequence represents a cone snail wconotoxin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conotoxin; MVIIC; peptide library; disulphide bond; biological activity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents an omega-conopeptide. Omega-conopeptides are components of peptide toxins which act as voltage-gated calcium channel inhibitors. The peptides are used to enhance the analgesic effect produced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is able to inhibit electrically stimulated contraction of the guinea pig ileum and bind to omega-conopeptide MVIAb binding sites present in neuronal tissue. Omega-conopeptides are useful for enhancing the analgesic effect produced by an opiate. Omega-conopeptides may also be used in the treatment of pain, in reducing neuronal damage related to an ischemic condition in mammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                         Omega-conopeptide; voltage-gated calcium channel inhibitor; analgesic; peptide toxin; opiate; pain; neuronal damage; ischemic condition; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig ilium and binds to omega-conopeptide MVIIA binding sites in neuronal
tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for manufacturing a peptide

[Ibrary comprising a peptide (I) having 2 or more intramolecular

[Ibrary comprising a peptide (I) having 2 or more intramolecular

[Ibrary comprising and its variants (V). The method comprises

[Ibrary and its variants (V). The method comprises

[Ibrary obtained by the above said method; (2) screening for mutant

[Ibrary obtained by the above said method; (2) screening for mutant

[Ibrary obtained by the above said method; (2) screening for mutant

[Ibrary obtained by the above said method; (3) a mutant peptide obtained

[Ibrary obtained by the above said method; and (4) a calcium channel blocker

[Ibrary obtaining of screening method; and (4) a calcium channel blocker

[Ibrary with a wild type peptide. The method is useful for

[Ibrary obtaining of screening method; and (4) a calcium channel blocker

[Ibrary obtaining of screening method; and for screening peptides with increased

[Ibrary obtaining of screening method; and for screening nethod is suitable

[Ibrary obtaining of screening method; and for screening peptides with increased

[Ibrary obtaining of screening method; and for screening method is suitable

[Ibrary obtaining of screening method; and for screening method is suitable

[Ibrary obtaining of screening method; and for screening method; and the screening method; and for screening method; and for screening method; and the screening method; 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents an omega-conotoxin MVIIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Omega-conotoxin; conus; Conus magus; alpha-conotoxin; mu-conotoxin; nicotinic acetylcholine receptor; venom; skeletal muscle; inhibitor; sodium ion channel; presynaptic neuronal calcium ion channel; therapy; P-like subtype; N-type channel; respiratory rhythm; respiratory control; neural developmental syndrome; respiratory crisis; Lambert-Eaton myasthenic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                    peptide mixture for synthesizing peptide of interest and its variants, forming intramolecular disulphide bonds between peptides and separating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              simultaneously, The present sequence represents an omega-conotoxin MYLI
peptide which is given in the exemplification of the present invention

AAW12800-W12804 represent omega-conotoxins isolated from Conus magus.

This sequence represents the MVIIC Conus magus omega-conotoxins. Conus verom contains three types of disulphide rich peptides, these are the alpha-conotoxins target and block the nicotinic acetylcholine receptors, the author conotoxins target and block the nicotinic acetylcholine receptors, the mucro conotoxins target and block the skeletal muscle sodium ion channels, and the comparation are receptors, the mucro conotoxins target and block the presynaptic neuronal calcium con channels. The omega-conotoxin peptides of the invention can target P-CC like subtypes of calcium ion channels, as well as the N-type channels can also be used for distinguishing the types of calcium ion channels. The presence or absence of sites for the peptides can be calcions, thereby characterising calcium ion channel expressing calls into various types. As these sequences affect the control of respiratory rhythms in vivo, they can be used to evaluate abnormalities in respiratory control which are particularly severe in the neonatal period. The peptides can also be used for assessing neural everyphental syndromes that result in respiratory crisis, and can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sea squirt protein with tissue specific expression in development Seq112.

                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel genes and the encoded proteins thereof
that are derived from the sea squirt Ciona intestinalis. Specifically, it
refers to those genes that are expressed in the tissues or organs of the
cas squirt during its developmental phase. The present invention
describes the identification of these genes as useful for elucidation of
the mechanism of development and hence for developing reseneration
medicines and gene therapy techniques. Accordingly, they can be used in
the research of various genetic diseases, as well as the analysis of cell
proliferation, differentiation and reproduction. Furthermore, such
compositions can be useful for environmental measurements and water
surveys, particularly for sea water surveys, and also for the preparation
of transformed sea squirt for improving edibility of sea squirt such as
Halocynthia roretzi. This polypeptide sequence is a sea squirt protein
sequence that has tissue specific expression during development, given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7
                                                                                                                                                                                                                                Novel gene cluster which is specifically expressed in tissue or organ during developmental phase of sea squirt, useful for elucidation of mechanism of development of tissue or organ of sea squirt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cell differentiation, notch; epidermis; cytostatic; dermatological; epithelial; skin; cancer; gamma secretase; notch-1.

```
The invention relates to a method of inducing differentiation of at least one spithelial cell. The method involves exogenously providing at least one source of at least one Notch agonist to at least one epithelial cell, whereby the Notch pathway is activated within at least one epithelial cell, whereby the Notch pathway is activated within at least one epithelial cell, whereby the Notch pathway is activated within at least one epithelial cell, cell so that the differentiation of the cell is induced. Methods of producing differentiated epidermis; for assaying for genetic propensity of a patient to develop a disorder associated with epithelial barrier formation; for retarding progression of skin cancer and for diagnosing aggressive melanoma are also provided. The methods are useful for inducing differentiation of at least one epithelial cell e.g. a charching actions of epithelial cell within cutaneous epithelial tissue or dermal equivalent, or within extracutaneous epithelial tissue or dermal equivalent, or within extracutaneous epithelial. The methods are useful retarding the progression of skin cancer such as aggressive melanoma, aggressive cutaneous T-cell lymphoma (CTCL), aggressive squamous cell carcinoma, or aggressive basal cell carcinoma, by preferably administering an antagonist of the Notch pathway concarticities.
                                                                                                                                                                                                                                                                                                                                                Inducing differentiation of epithelial cell useful for inducing barrier formation within epithelium for treating psoriasis, sunburn, involves exogenously providing a source of a Notch agonist to the epithelial cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics.

Disclosure; SEQ ID NO 469; 1498pp; English.

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism.

diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diagnostic and prognostic assays and furthermore in the treatment of diagnostic and diagnostic as well as methods to modulate their expression using antisense oligos, riboxymes and peptide nucleic acids. The NOWX polypeptides, polynucleotides and antibodies are useful in treating or preventing NoWX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune to disorders, albrodiances. Purthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune and isorders, albrodiances, and epithepsy, Accordingly, these molecules have many activities including cytostatic, cardiant, antidiahetic, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiahetic, antiarteriosclerotic, anorectic, antiaxant and anticonvulsant. In addition, they are useful in screening casasays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also the incorporation. This polypeptide is a homologue of a human NOVX protein ö Specifically, it refers to the use of biologically active fragments for Gaps ; 0 Query Match 56.7%; Score 68; DB 5; Length 2444; Best Local Similarity 30.8%; Pred. No. 1.5e+03; Matches 8; Conservative 12; Mismatches 6; Indels 248 GFTGONCEENIDDCPGNNCKNGGACV 273 2 XIXNQXCXQXLDDCCSXXCNXXNXCV 27 Search completed: April 18, 2005, 20:33:43 Job time : 127.5 secs Sequence 2444 AA; of the invention. 셤 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence Sequence Sequence 1

Sequence 18, Application US/08185432

Patent No. 5750652

GENERAL INFORMATION:

APPLICANT: Arcavania-Tsakonas, Spyridon

APPLICANT: Diederich, Robert J.

APPLICANT: Matsuno, Kenji

TITLE OF INVENTION: DELFEX PROTEINS, NUCLEIC ACIDS, AND

TITLE OF INVENTION: ANTIBODIES, AND RELATED METHODS AND COMPOSITIONS

NUMBER OF SEQUENCES: 23

CORRESPONDENCE ADDRESS:

ADDRESSEE: PENNIE & EDMONDS

STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

Patent No. 5587454

GENERAL INFORMATION:
APPLICANT: JUSTICE, ALAN
APPLICANT: GOHIL, KISHOR C
APPLICANT: WALENTINO, KAREN L
APPLICANT: MILJANICH, GEORGE P
TITLE OF INVENTION: METHODS OF PRODUCING ANALGESIA AND
TITLE OF INVENTION: ENHANCING OPIATE ANALGESIA
NUMBER OF SEQUENCES: 34
APPLICANT: SINGH, TEJINDER
APPLICANT: GOHIL, KLSHOR C
APPLICANT: VALENTINO, KESHOR L
APPLICANT: VALENTINO, REORGE P
TITLE OF INVENTION: METHODS OF PRODUCING ANALGESIA AND
TITLE OF INVENTION: BNHANCING OPIATE ANALGESIA
NUMBER OF SEQUENCES: 34
CORRESPONDENCE ADDRESS: ADDRESSE: LAW Offices of Peter Deblinger
                                                                                                                                                                                                                                                                                                                                                                       CURPLIANT TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 21, Application US/08742774

Patent No. 5824645

GENERAL INFORMATION:
APPLICANT: JUSTICE, ALAN
APPLICANT: GOHIL, KISHOR C
APPLICANT: WALENTINO, KAREN L
APPLICANT: MILJANICH, GEDRGE P
TITLE OF INVENTION: METHODS OF PRODUCING ANALGESIA
TITLE OF INVENTION: ENHANCING OPIATE ANALGESIA
NUMBER OF SEQUENCES: 34
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ; OTHER INFORMATION: /note= "where X is hydroxyproline"

Sequence 17, Application US/08185432

Patent No. 5750652

GENERAL INFORMATION:
APPLICANT: Artavanis-Teakonas, Spyridon
APPLICANT: Busseau, Isabelle
APPLICANT: Busseau, Isabelle
APPLICANT: Mateuno, Kenji
TITLE OF INVENTION: DELTEX PROTEINS, NUCLEIC ACIDS, AND
TITLE OF INVENTION: DELTEX PROTEINS, NUCLEIC ACIDS, AND
TITLE OF INVENTION: ANTIBODIES, AND RELATED METHODS AND COMPOSITIONS
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS: 23
CORRESPONDENCE ADDRESS:
STREET: 1155 Avenue of the Americas
CITY: New York
